Using IntegratedLearner for Multi-omics Prediction and Classification

Himel Mallick, Nalin Arora and Anupreet Porwal

2026-03-10

This vignette is a practical tutorial for binary, continuous, and survival outcome workflows in `IntegratedLearner`.

The goal is to show a complete end-to-end pattern you can adapt to your own multi-omics study:

1. Build correctly formatted training/validation inputs.
2. Fit per-layer, stacked, and concatenated learners.
3. Interpret model outputs (AUC/R2, layer weights, and feature signals).

`IntegratedLearner` supports three integration paradigms:

- Early fusion: concatenated features across layers.
- Late fusion: layer-specific models combined by a meta-learner.
- Intermediate fusion: additional integration strategies for downstream analysis.

Load Packages

```
# Main package
library(IntegratedLearner)

# Needed for BART-based sections
options(java.parameters = "-Xmx6G")

# Tutorial dependencies
library(tidyverse)
library(SuperLearner)
library(caret)
library(cowplot)
library(bayesplot)
library(bartMachine)
library(curatedMetagenomicData)
library(TreeSummarizedExperiment)
library(SummarizedExperiment)
library(MultiAssayExperiment)
library(survival)
library(S4Vectors)
```

Input Data Contract

For the `PCL_*` interface used in this tutorial, each dataset is a list with:

- `feature_table`: data frame with features in rows and samples in columns.
- `sample_metadata`: data frame with samples in rows. Must include:
  - `subjectID`: subject identifier (can repeat for longitudinal data).
  - `Y`: outcome (binary, continuous, or survival-encoded).
- `feature_metadata`: data frame with features in rows. Must include:
  - `featureID`: unique feature identifier.
  - `featureType`: layer label (for example, species, metabolites).

Required alignments:

- `rownames(feature_table) == rownames(feature_metadata)`
- `colnames(feature_table) == rownames(sample_metadata)`

If you provide a validation set, it must use the same feature set and ordering as training.

For survival workflows, include `time` and `event` columns in `sample_metadata` (with `event` coded as 0/1). You can also provide `Y` as a `Surv(time, event)` object.

Alternative Input Mode: MAE (Complete Binary Example)

`IntegratedLearner` accepts `MultiAssayExperiment` inputs through `MAE_train`/`MAE_valid`. This is often the cleanest path when each omics layer is already represented as a `SummarizedExperiment`/`TreeSummarizedExperiment`.

```
# 1) Download two aligned layers from curatedMetagenomicData
asnicar_tax <- curatedMetagenomicData(
  "DavidLA_2015.relative_abundance",
  dryrun = FALSE
)[[1]]
#>
#> $`2021-03-31.DavidLA_2015.relative_abundance`
#> dropping rows without rowTree matches:
#>   k__Bacteria|p__Actinobacteria|c__Coriobacteriia|o__Coriobacteriales|f__Coriobacteriaceae|g__Collinsella|s__Collinsella_ste

#>   k__Bacteria|p__Actinobacteria|c__Coriobacteriia|o__Coriobacteriales|f__Coriobacteriaceae|g__Enorma|s__[Collinsella]_massi
```

```
#>   k__Bacteria|p__Firmicutes|c__Bacilli|o__Lactobacillales|f__Carnobacteriaceae|g__Granulicatella|s__Granulicatella_elegans

#>   k__Bacteria|p__Proteobacteria|c__Betaproteobacteria|o__Burkholderiales|f__Sutterellaceae|g__Sutterella|s__Sutterella_parvi

asnicar_path <- curatedMetagenomicData(
  "DavidLA_2015.pathway_abundance",
  dryrun = FALSE
)[[1]]

tax_tse  <- as(asnicar_tax,  "TreeSummarizedExperiment")
path_tse <- as(asnicar_path, "TreeSummarizedExperiment")

# 2) Keep common samples in both layers
common_samples <- intersect(colnames(tax_tse), colnames(path_tse))
common_samples <- as.character(common_samples)

tax_tse  <- tax_tse[, common_samples]
path_tse <- path_tse[, common_samples]

# 3) Build binary outcome and subject IDs inside each experiment
Yvec <- ifelse(as.character(colData(tax_tse)$disease) == "healthy", 0L, 1L)

SummarizedExperiment::colData(tax_tse)$Y <- Yvec
SummarizedExperiment::colData(path_tse)$Y <- Yvec

SummarizedExperiment::colData(tax_tse)$subjectID <- common_samples
SummarizedExperiment::colData(path_tse)$subjectID <- common_samples

# 4) Build top-level MAE colData
cd <- S4Vectors::DataFrame(
  Y = as.integer(Yvec),
  subjectID = common_samples,
  row.names = common_samples
)

# 5) Build explicit sampleMap
smap <- S4Vectors::DataFrame(
  assay   = c(rep("taxonomy", length(common_samples)),
              rep("pathway",  length(common_samples))),
  primary = c(common_samples, common_samples),
  colname = c(common_samples, common_samples)
)

smap$assay   <- as.character(smap$assay)
smap$primary <- as.character(smap$primary)
smap$colname <- as.character(smap$colname)

# 6) Build MAE container
mae <- MultiAssayExperiment(
  experiments = ExperimentList(
    taxonomy = tax_tse,
    pathway  = path_tse
  ),
  colData = cd,
  sampleMap = smap
)

# 7) Stratified train/validation split
y <- MultiAssayExperiment::colData(mae)$Y
names(y) <- rownames(MultiAssayExperiment::colData(mae))

set.seed(1)

i0 <- which(y == 0)
i1 <- which(y == 1)

train0 <- sample(i0, floor(0.7 * length(i0)))
train1 <- sample(i1, floor(0.7 * length(i1)))

train_ids <- names(y)[sort(c(train0, train1))]
valid_ids <- setdiff(names(y), train_ids)

mae_train <- mae[, train_ids]
mae_valid <- mae[, valid_ids]

# 8) Fit IntegratedLearner in MAE mode
fit_mae_bin <- IntegratedLearner(
  MAE_train = mae_train,
  MAE_valid = mae_valid,
  experiment = c("taxonomy", "pathway"),
  assay.type = c("relative_abundance", "pathway_abundance"),
  folds = 3,
  base_learner = "SL.randomForest",
  meta_learner = "SL.nnls.auc",
  family = binomial(),
  verbose = TRUE
)

```

The returned object is the same style as `PCL` mode, so downstream interpretation (`AUC.train`, `R2.train`, `weights`, `plot.learner`) is unchanged.

Parameter Reference (Conbin and Survival)

Common Wrapper Parameters (`IntegratedLearner`)

Parameter	Default	Applies to	Description
			MAE-mode inputs

`MAE_train`, `MAE_valid`	`NULL`	all	(training and optional validation).
`PCL_train`, `PCL_valid`	`NULL`	all	PCL-mode inputs (training and optional validation).
`experiment`	`NULL`	MAE mode	Selected MAE experiment names/indices; defaults to all experiments.
`assay.type`	`NULL`	MAE mode	Assay names per selected experiment.
`na.rm`	`FALSE`	all	Drop features with missing values after extraction/prep.
`folds`	`5`	all	Outer CV folds.
`seed`	`1234`	all	Reproducibility seed.
`base_learner`	`"SL.BART"`	all	Base learner. Use `SL.*` IDs for continuous/binary and explicitly set a supported `surv.*` ID for survival runs.
`verbose`	`FALSE`	all	Print progress.
`family`	`gaussian()`	all	Non-survival: `gaussian()`/`binomial()`. Survival is auto-detected from metadata or family.
`...`	—	all	Passed to the selected backend (`IL_conbin` or `ILsurv`).

Conbin-Specific Parameters (Continuous/Binary Path)

Parameter	Default	Description
`base_screener`	`"All"`	SuperLearner screener used with base learner.
`meta_learner`	`"SL.nnls.auc"`	Stacked meta learner for late fusion.
`run_stacked`	`TRUE`	Enables late-fusion stacked model.
`run_concat`	`TRUE`	Enables early-fusion concatenated model.
`print_learner`	`TRUE`	Prints fit summary.
`refit.stack`	`FALSE`	Refit stacked learner on full data for final predictions.

Survival-Specific Parameters (via `...`)

Parameter	Default	Description
`do_early_fusion`	`TRUE`	Train an early-fusion survival model on all features.
`weight_method`	`"IBS"`	Late-fusion weighting objective (`"IBS"` or `"COX"`).
`intermediate_learners`	`c("surv.coxph")`	Intermediate fusion learners on layer-risk features.
`t_vec`, `t_vec_probs`	`NULL`, quantiles	Time grid used in COX-style weighting summaries.
`layer_score`	`"sum"`	Aggregation of cumulative hazard increments (`sum`, `mean`, `l2`).
`weight_lambda`	`0.02`	Regularization strength for COX weighting optimizer.
`weight_penalty`	`"l2_to_uniform"` or `"entropy"`	Penalty used while learning survival late-fusion weights.
`weight_cap`	`1.0`	Optional cap on individual layer weights.
`optim_maxit_cox`	`4000`	Max iterations for COX weighting optimization.
`optim_maxit_ibs`	`300`	Max iterations for IBS weighting optimization.
`ibs_shrink_to_uniform`	`0`	Shrink IBS weights toward uniform blend.

Supported Models and Fusion Modules

Supported Models

Path	Supported base models
Continuous/Binary (`IL_conbin`)	Any `SuperLearner`-compatible `SL.*` learner available in your R session. Package wrappers include: `SL.BART`, `SL.LASSO`, `SL.enet`, `SL.glmnet2`, `SL.horseshoe`, `SL.mxBART` (plus standard SuperLearner learners such as `SL.glm`, `SL.randomForest`, etc.).
Survival (`ILsurv`)	Built-in survival learner IDs: `surv.coxph`, `surv.glmnet`, `surv.ranger`, `surv.ranger.extratrees`, `surv.ranger.maxstat`, `surv.ranger.C`, `surv.rfsrc`, `surv.coxboost`, `surv.gbm`, `surv.xgboost.cox`, `surv.xgboost.aft`, `surv.mboost`, `surv.bart`.

Supported Fusion Outputs

Path	Single-layer	Early fusion	Late fusion	Intermediate fusion
Continuous/Binary	Yes	`run_concat = TRUE`	`run_stacked = TRUE` with `meta_learner`	Not a separate branch in `IL_conbin`
Survival	Yes (`train_out$single`)	`do_early_fusion = TRUE`	Weighted layer blending (`weight_method = "IBS"` or `"COX"`)	`intermediate_learners` on layer-risk summaries

Output Reference: What You Get and How to Access It

This section summarizes the outputs produced by each integration method and where to find weights/importance values.

Conbin Outputs (Binary/Continuous)

Method	What it returns	Where to access
Single-layer (per omics layer)	Layer-specific predictions and metrics	`fit$yhat.train[, layer_name]`, `fit$yhat.test[, layer_name]` (if validation), `fit$AUC.train` / `fit$AUC.test` (binomial), `fit$R2.train` / `fit$R2.test` (gaussian)
Early fusion (concatenated)	One model on all features concatenated	Enable with `run_concat = TRUE`; outputs in `fit$yhat.train[, "concatenated"]`, `fit$model_fits$model_concat`, `fit$SL_fits$SL_fit_concat`
Late fusion (stacked)	Meta-model over layer-level predictions	Enable with `run_stacked = TRUE`; outputs in `fit$yhat.train[, "stacked"]`, `fit$model_fits$model_stacked`, `fit$SL_fits$SL_fit_stacked`
Layer weights (stacked)	Relative contribution of each layer in late fusion	`fit$weights` (available when `meta_learner = "SL.nnls.auc"` and `run_stacked = TRUE`)

Survival Outputs (Single/Early/Late/Intermediate)

Method	Training outputs	Validation outputs
Single-layer	`fit$train_out$single$metrics`	`fit$valid_out$single$valid_cindex`, `fit$valid_out$single$valid_auc`
Early fusion	`fit$train_out$early$train_cindex`, `fit$train_out$early$train_auc`	`fit$valid_out$early$valid_cindex`, `fit$valid_out$early$valid_auc`
Late fusion	`fit$train_out$late$weights`, `fit$train_out$late$train_cindex`, `fit$train_out$late$train_auc`	`fit$valid_out$late$valid_cindex`, `fit$valid_out$late$valid_auc`
Intermediate fusion	`fit$train_out$intermediate` (per learner listed in `intermediate_learners`)	`fit$valid_out$intermediate`

Importance Outputs (Conbin and Survival)

Importance type	Where to access	Notes
Conbin signed global feature importance	`fit$feature_importance_signed`	Always returned for non-survival fits; named numeric vector sorted by effect magnitude/sign.
Conbin signed per-layer importance	`fit$feature_importance_signed_by_layer`	List split by `featureType`.
Survival early-fusion combined importance	`fit$train_out$early$combined_importance`	Available when `do_early_fusion = TRUE`.
Survival late-fusion combined importance	`fit$train_out$late$combined_importance`	Weighted signed importance; names are prefixed like `layer::feature`.
BART-specific layer importance (optional)	`bartMachine::investigate_var_importance(fit$model_fits$model_layers[[layer]], plot = FALSE)`	Only for BART-based conbin fits (`base_learner = "SL.BART"`).

Quick Access Snippets

```
# ---- Conbin: weights + top features ----
fit$weights
head(fit$feature_importance_signed, 20)
names(fit$feature_importance_signed_by_layer)
head(fit$feature_importance_signed_by_layer[[1]], 20)

# ---- Survival: late-fusion weights + top combined features ----
fit_surv$train_out$late$weights
head(fit_surv$train_out$late$combined_importance, 20)

# ---- Survival: inspect all fusion branches ----
fit_surv$train_out$single
fit_surv$train_out$early
fit_surv$train_out$late
fit_surv$train_out$intermediate
```

Example 1: Binary Outcome (IBD Classification)

This section uses the PRISM dataset (Franzosa et al., 2019) for classifying IBD status. The binary target is coded in `sample_metadata$Y`.

Step 1: Load and Inspect Training and Validation Data

```
# Training data
load(url("https://github.com/himelmallick/IntegratedLearner/blob/master/data/PRISM.RData?
        raw=true"))

feature_table <- pcl$feature_table
sample_metadata <- pcl$sample_metadata
feature_metadata <- pcl$feature_metadata
rm(pcl)

# Quick checks
head(feature_table[1:5, 1:5])
#>                                G35127      G35128      G35152       G36347
#> Granulicella_unclassified -0.05253649 -0.05127158 -0.06133085  0.004887447

#> Actinomyces_graevenitzii   Actinomyces_graevenitzii     species
#> Actinomyces_johnsonii         Actinomyces_johnsonii     species
#> Actinomyces_massiliensis   Actinomyces_massiliensis     species
#> Actinomyces_naeslundii       Actinomyces_naeslundii     species

table(feature_metadata$featureType)
#>
#> metabolites     species
#>        8831         340
table(sample_metadata$Y)
#>
#>   0   1
#>  34 121

all(rownames(feature_table) == rownames(feature_metadata))
#> [1] TRUE
all(colnames(feature_table) == rownames(sample_metadata))
#> [1] TRUE

# Independent validation data
load(url("https://github.com/himelmallick/IntegratedLearner/blob/master/data/NLIBD.RData?
        raw=true"))
feature_table_valid <- pcl$feature_table
sample_metadata_valid <- pcl$sample_metadata
rm(pcl)

all(rownames(feature_table) == rownames(feature_table_valid))
#> [1] TRUE
all(colnames(feature_table_valid) == rownames(sample_metadata_valid))
#> [1] TRUE
```

Step 2: Build PCL Inputs

```
PCL_train <- list(
  feature_table = feature_table,
  sample_metadata = sample_metadata,
  feature_metadata = feature_metadata
)

PCL_valid <- list(
  feature_table = feature_table_valid,
  sample_metadata = sample_metadata_valid,
  feature_metadata = feature_metadata
)
```

Step 3: Fit the Model

`IntegratedLearner` fits one model per layer (`base_learner`) and then combines layer-level predictions with a meta-learner (`meta_learner`).

```
fit <- IntegratedLearner(
  PCL_train = PCL_train,
  PCL_valid = PCL_valid,
  folds = 5,
  base_learner = "SL.randomForest",
  meta_learner = "SL.nnls.auc",
  verbose = TRUE,
  family = binomial()
)
#> Running base model for layer  1 ...

#> Model fit for concatenated layer: SL.randomForest
#> ========================================
#> AUC metric for training data:
#> Individual layers:
#> metabolites     species
#>       0.934       0.955
#> ======================
#> Stacked model:0.951
#> ======================
#> Concatenated model:0.957
#> ======================
#> ========================================
#> AUC metric for test data:
#> Individual layers:
#> metabolites     species
#>       0.782       0.879
#> ======================
#> Stacked model:0.908
#> ======================
#> Concatenated model:0.895
#> ======================
#> ========================================
#> Weights for individual layers predictions in IntegratedLearner:
#> metabolites     species
#>        0.18        0.82
#> ========================================
```

Step 4: Inspect and Interpret Outputs

Core outputs for binary tasks include:

- `fit$AUC.train` and `fit$AUC.test`: AUC per layer and fusion model.
- `fit$weights`: layer contributions in the stacked model (when `SL.nnls.auc` is used).
- `fit$yhat.train` and `fit$yhat.test`: predicted probabilities.

```
fit$AUC.train
#>  metabolites      species      stacked concatenated
#>        0.934        0.955        0.951        0.957
fit$AUC.test
#>  metabolites      species      stacked concatenated
#>        0.782        0.879        0.908        0.895
fit$weights
#> metabolites     species
#>   0.1801901   0.8198099
```

Plot ROC summaries for train and validation sets:

```
plot.obj <- IntegratedLearner:::plot.learner(fit)
```

In this PRISM setting, you can compare which single layer is strongest and whether stacked fusion outperforms both individual layers and simple concatenation.

Example 2: Continuous Outcome (Gestational Age)

This section uses the pregnancy dataset (Ghaemi et al., 2019), where `Y` is continuous gestational age.

Step 1: Load and Inspect Data

```
load(url("https://github.com/himelmallick/IntegratedLearner/blob/master/data/pregnancy.RData?
        raw=true"))

feature_table <- pcl$feature_table

#> [1] TRUE

# Optional speed-up for local experimentation
# top_n <- 50
# subsetIDs <- c(1:top_n, (nrow(feature_table) - top_n + 1):nrow(feature_table))
# feature_table <- feature_table[subsetIDs, ]
# feature_metadata <- feature_metadata[subsetIDs, ]
```

Step 2: Build PCL Input

```
PCL_train <- list(
  feature_table = feature_table,
  sample_metadata = sample_metadata,
  feature_metadata = feature_metadata
)
```

Step 3: Fit Continuous Model

For this example, we use BART base learners (`SL.BART`) with leave-one-subject-out style CV (`folds = 17`).

```
fit <- IntegratedLearner(
  PCL_train = PCL_train,
  folds = 17,
  base_learner = "SL.BART",
  meta_learner = "SL.nnls.auc",
  family = gaussian()
)

#> Weights for individual layers predictions in IntegratedLearner:
#>     CellfreeRNA    ImmuneSystem    Metabolomics      Microbiome   PlasmaLuminex
#>           0.000           0.000           0.238           0.588           0.000
#> PlasmaSomalogic    SerumLuminex
#>           0.174           0.000
#> ========================================
```

Step 4: Evaluate Predictive Accuracy

For continuous outcomes, `IntegratedLearner` reports `R2.train` (and `R2.test` if validation is provided).

```
fit$R2.train
#>     CellfreeRNA    ImmuneSystem    Metabolomics      Microbiome   PlasmaLuminex
#>      0.08548959      0.20491045      0.67114346      0.74893855      0.18314107
#> PlasmaSomalogic    SerumLuminex         stacked    concatenated
#>      0.63949095      0.09200745      0.81205589      0.68805530
```

```
plot.obj <- IntegratedLearner:::plot.learner(fit)
```

Step 5: Uncertainty and Feature-Level Interpretation (BART)

When using `SL.BART`, you can inspect posterior predictive distributions and derive weighted posterior summaries.

```
weights <- fit$weights

dataX <- fit$X_train_layers
dataY <- fit$Y_train

post.samples <- vector("list", length(weights))
names(post.samples) <- names(dataX)

for (i in seq_along(post.samples)) {
  post.samples[[i]] <- bart_machine_get_posterior(
    fit$model_fits$model_layers[[i]],
    dataX[[i]]
  )$y_hat_posterior_samples
}

weighted.post.samples <- Reduce("+", Map("*", post.samples, weights))
rownames(weighted.post.samples) <- rownames(dataX[[1]])
names(dataY) <- rownames(dataX[[1]])
```

Visualize 68% and 95% credible intervals for observations:

```
ord_names <- names(sort(rowMeans(weighted.post.samples), decreasing = TRUE))

mcmc_intervals(t(weighted.post.samples), prob = 0.68, prob_outer = 0.95) +
  scale_y_discrete(limits = ord_names) +
  geom_point(aes(x = dataY[ord_names], y = ord_names), shape = 1, size = 3, color = "black") +
  coord_flip() +
  theme_bw() +
  labs(
    x = "Gestational age (in months)",
    y = "Observations"
  ) +
  theme(axis.text.x = element_text(angle = 90, hjust = 1))
#> Scale for y is already present.
#> Adding another scale for y, which will replace the existing scale.
```

Layer weights and feature-level inclusion proportions can also be examined for biological interpretation.

```
omicsEye_theme <- function() {
  angle <- 45
  hjust <- 1
  ggplot2::theme_bw() +
    ggplot2::theme(
      axis.text.x = ggplot2::element_text(size = 8, vjust = 1, hjust = hjust, angle = angle),
      axis.text.y = ggplot2::element_text(size = 8, hjust = 1),
      axis.title = ggplot2::element_text(size = 10),
      plot.title = ggplot2::element_text(size = 10),
      plot.subtitle = ggplot2::element_text(size = 8),
      legend.title = ggplot2::element_text(size = 6, face = "bold"),
      legend.text = ggplot2::element_text(size = 7),
      axis.line = ggplot2::element_line(colour = "black", linewidth = 0.25),
      axis.line.x = ggplot2::element_line(colour = "black", linewidth = 0.25),
      axis.line.y = ggplot2::element_line(colour = "black", linewidth = 0.25),
      panel.border = ggplot2::element_blank(),
      panel.grid.major = ggplot2::element_blank(),
      panel.grid.minor = ggplot2::element_blank()
    )
}

safe_var_importance <- function(model, layer_label) {
  tryCatch({
    qq <- bartMachine::investigate_var_importance(model, plot = FALSE)

  theme_bw() +
  coord_flip() +
  omicsEye_theme() +
  theme(strip.background = element_blank()) +
  ylab("Inclusion proportion") +
  xlab("")
```

```r
plot_grid(
  p4,
  ncol = 1,
  labels = c("Estimated IntegratedLearner Layer Weights"),
  label_size = 8,
  vjust = 0.1
) + theme(plot.margin = unit(c(0.5, 0.5, 0.5, 0.5), "cm"))
```

```r
plot_grid(
  p5,
  ncol = 1,
  labels = c("Top Features by Layer (BART Inclusion Proportions)"),
  label_size = 8,
  vjust = 0.1
) + theme(plot.margin = unit(c(0.5, 0.5, 0.5, 0.5), "cm"))
```

Example 3: Survival Outcome (Time-to-event)

For survival tasks, `IntegratedLearner` dispatches to `ILsurv` when survival metadata are detected. The expected fields are:

- `time`: follow-up time (non-negative).
- `event`: event indicator (`0/1`).
- optional `Y`: `Surv(time, event)` convenience column.

This path uses the package-native survival backend (no `mlr3` dependency required).

This section provides a complete MAE workflow, followed by an equivalent PCL sketch.

Step 1: Construct MAE Survival Inputs from TCGA_BRCA

```
load(url("https://github.com/himelmallick/IntegratedLearner/blob/master/data/Survival/TCGA_BRCA.RData?
        raw=true"))

# Objects loaded: gene_all, mir_all

# Keep deterministic ordering
gene_all <- gene_all[order(gene_all$patient_id), ]
mir_all  <- mir_all[order(mir_all$patient_id), ]
rownames(gene_all) <- gene_all$patient_id
rownames(mir_all)  <- mir_all$patient_id

# Sample metadata
sample_ids <- rownames(gene_all)
sample_metadata <- data.frame(
  subjectID = sample_ids,
  time = gene_all$OS.time,
  event = gene_all$OS,
  Y = Surv(gene_all$OS.time, gene_all$OS),
  row.names = sample_ids
)

# Feature matrices (features in rows)
drop_cols <- c("patient_id", "age", "stage_i", "stage_ii", "race_white", "OS.time", "OS")
mat_gene <- t(as.data.frame(gene_all[, setdiff(names(gene_all), drop_cols)]))
mat_mirna <- t(as.data.frame(mir_all[, setdiff(names(mir_all), drop_cols)]))

# Per-layer SummarizedExperiments
se_gene <- SummarizedExperiment(
  assays = list(relative_abundance = mat_gene),
  colData = S4Vectors::DataFrame(sample_metadata[colnames(mat_gene), ])
)

se_mirna <- SummarizedExperiment(
```

```
  assays = list(pathway_abundance = mat_mirna),
  colData = S4Vectors::DataFrame(sample_metadata[colnames(mat_mirna), ])
)

mae <- MultiAssayExperiment(
  experiments = list(taxonomy = se_gene, pathway = se_mirna),
  colData = S4Vectors::DataFrame(sample_metadata)
)
```

Step 2: Split MAE into Training and Validation

```
set.seed(1)
idx <- sample(seq_along(sample_ids), size = floor(0.7 * length(sample_ids)))
mae_train <- mae[, idx, ]
mae_valid <- mae[, -idx, ]

# Utility to keep Y/time/event present in every experiment colData after subsetting
propagate_Y <- function(mae_obj) {
  exps <- MultiAssayExperiment::experiments(mae_obj)
  for (nm in names(exps)) {
    se <- exps[[nm]]
    if (!"Y" %in% colnames(SummarizedExperiment::colData(se))) {
      cd <- as.data.frame(MultiAssayExperiment::colData(mae_obj))[colnames(se), , drop =
        FALSE]
      SummarizedExperiment::colData(se) <- S4Vectors::DataFrame(cd)
    }
    exps[[nm]] <- se
  }
  MultiAssayExperiment::experiments(mae_obj) <- exps
  mae_obj
}

mae_train <- propagate_Y(mae_train)
mae_valid <- propagate_Y(mae_valid)
```

Step 3: Fit Survival Model (MAE Mode)

```
fit_surv_mae <- IntegratedLearner(
  MAE_train = mae_train,
  MAE_valid = mae_valid,
  experiment = c("taxonomy", "pathway"),
  assay.type = c("relative_abundance", "pathway_abundance"),
  folds = 2,
  base_learner = "surv.coxboost",  # alternatives include
        surv.coxph/surv.ranger/surv.xgboost.cox/...
  weight_method = "COX",           # alternative: "IBS"
  verbose = TRUE
)
```

Step 4: Interpret Survival Outputs

```
# Single-layer training metrics
# fit_surv_mae$train_out$single$metrics

# Late fusion (weighted integration)
fit_surv_mae$train_out$late$weights
fit_surv_mae$train_out$late$train_cindex
fit_surv_mae$train_out$late$train_auc

# Early and intermediate fusion summaries
#fit_surv_mae$train_out$early
#fit_surv_mae$train_out$intermediate

# Validation metrics
fit_surv_mae$valid_out$late$valid_cindex
fit_surv_mae$valid_out$late$valid_auc
fit_surv_mae$valid_out$single$valid_cindex
```

Equivalent PCL Survival Pattern (Same Data)

```
# Convert to PCL-style objects if preferred:
feature_table <- as.data.frame(rbind(mat_gene, mat_mirna))
feature_metadata <- rbind(
  data.frame(featureID = rownames(mat_gene), featureType = "gene", row.names =
        rownames(mat_gene)),
  data.frame(featureID = rownames(mat_mirna), featureType = "mirna", row.names =
        rownames(mat_mirna))
)

PCL_train <- list(
  feature_table = feature_table[, rownames(sample_metadata)[idx], drop = FALSE],
  sample_metadata = sample_metadata[rownames(sample_metadata)[idx], , drop = FALSE],
  feature_metadata = feature_metadata
)
```

```r
PCL_valid <- list(
  feature_table = feature_table[, rownames(sample_metadata)[-idx], drop = FALSE],
  sample_metadata = sample_metadata[rownames(sample_metadata)[-idx], , drop = FALSE],
  feature_metadata = feature_metadata
)

fit_surv_pcl <- IntegratedLearner(
  PCL_train = PCL_train,
  PCL_valid = PCL_valid,
  folds = 2,
